

Pre-screening assignment — Full-stack build

Before you start

- **Time.** You have 3 working days from the time you receive this pack
- **AI tools.** You may use any AI tool (Claude, ChatGPT, Copilot or any other), any search engine and any library. We expect you to.
- **What this is.** Three parts. Part A is one small thing built end to end — data, back end, screen, a test — on a made-up Urbanrise scenario. Part B is five questions about your own work. Part C is one business problem for which you propose an approach. All data is synthetic.
- **What we look at.** Whether the thing works, whether you understood the user, whether you checked before you trusted, and how you handle the layer of the stack you know least. We are hiring for potential at 3–4 years of experience, not for polish. Where you are thin on a layer, do the simplest thing that works and say so.
- **Next step.** If your submission passes, we book a 30-minute video call within a week. You will open your own work and change something in it while we watch. Nothing to prepare.

First, how a home gets sold at Urbanrise (read this before Part A)

You do not need any real estate or sales background for this test. This is the whole process in six steps, so the scenario below makes sense.

- **Step 1 · Enquiry.** A person sees an advertisement or a listing and fills a form, calls, or walks in. This person is now a "lead" and gets a record in the company's customer system (the CRM).
- **Step 2 · Pre-sales call.** A pre-sales executive phones the lead, understands what they want (budget, flat size, area, when they want to move) and invites them to see the project.
- **Step 3 · Site visit booked.** If the lead agrees, a visit to the project site is fixed for a day and time and assigned to a site sales executive, the person who will meet them there.
- **Step 4 · Site visit.** The customer arrives at the site office; the site sales executive shows the model flat and the project and answers questions. Several visits happen per executive per day.
- **Step 5 · Outcome and next action.** After each meeting the executive records what happened (interested, needs time, not interested, or the customer did not come) and what happens next (send the price sheet, call on Monday, a second visit with the family).
- **Step 6 · Booking.** If the customer decides to buy, they pay a booking amount and the paperwork starts. Everything after that (payments, documents, handover) is another team's job and not part of this test.

Part A is about step 4 and step 5 only: the list of the day's visits for one executive, and recording the outcome and next action after each meeting.

Part A — Build one small thing end to end

The scenario. Urbanrise site sales executives meet customers who booked a site visit. Each executive needs, on their phone, the list of today's visits, and a way to record what happened after each meeting. Today this lives in a spreadsheet. `visits.csv` is that spreadsheet (24 visits across three executives and three days). `starter_api.js` is a first draft of the back end written by an AI assistant; you may start from it or from scratch, in any language. If you use it, fix what is wrong with it.

Files in your folder: `visits.csv`, `starter_api.txt`.

- **A1 · Back end.** A small service with two operations: list one executive's visits for one date; record an outcome and a next action for one visit. Rules: phone numbers leave the server showing only the last four digits; the outcome must be one of Interested, Needs time, Not interested, No show; bad input and unknown visits get a clear message and the right status code.
- **A2 · Screen.** One screen, any framework or plain HTML and JavaScript, that shows an executive's visits for a day, lets them set the outcome and next action, and shows the change. It must be usable on a phone-width screen with one thumb.
- **A3 · Prove it.** At least one automated test on the back end, a README that installs and runs everything in one command, and five lines on what you would test next and why.

- **A4 · Optional, 20 minutes.** Add a two-line brief per visit written by a language model from the visit's fields (call any AI API, or fake the call and say so). Then write three lines on what could go wrong when the sales team trusts that brief.

Part B — Your own work

Short answers, five to eight lines each. Specifics matter more than polish. Generic answers score zero, however well written.

1. The last production problem you fixed: the exact error or symptom, the real root cause, and what changed afterwards so it could not recur.
2. One number you moved at work: what it was, the value before, the value after, and how it was measured. If you are not sure the change was yours, say so.
3. A time an AI tool gave you something wrong: what it said, how you noticed, and what you do differently now.
4. Something you built that you would build differently today, and why.
5. Which layer of the stack are you weakest on today — database, back end, front end, or running things in production — and how exactly would you close that gap in your first 90 days here?

Part C — The business problem

Site Visit use case 1 — "Many customers confirm a site visit and then do not turn up." The pre-sales team books the visit on the phone, sends a WhatsApp reminder, and about half the customers do not come. Executives wait at the site; the customer's interest cools. The company wants fewer no-shows and, when a customer will not come, to know early and use the slot for someone else.

Write no more than one page, in plain language, under four headings:

- **Approach.** What you would build or buy, and how it plugs into the CRM and the systems around it.
- **Measure.** The one number that tells us it worked, its value today if you can guess it, and the target.
- **First two weeks.** What you would actually do on day 1 to day 10.
- **What could go wrong.** The two or three ways this fails in a real estate company, and what you would do about them.

Submission checklist

- Code as plain files, with the README
- Part B and Part C answers as one document
- An appendix listing the AI tools and prompts you used
- Your name in the message, not in file names

Send everything back to the same WhatsApp number or email address you received this from, within 3 working days: your code as plain files (no zips or environments), a README that runs it in one command, your written answers as one document, and your AI-use appendix. Please do not put personal data in file names.
